LEAD SCORING CASE STUDY

Submitted By:

Shubham Dhar Shriya Gandreti Shruti kumar

PROBLEM STATEMENT

- An education company named X sells online courses to industry professionals. They have a process of online form filling on their website.
- When these people fill up a form providing their email address or phone number, they are classified to be a lead. Once acquired, employees from the sales team start making calls, writing emails, etc. and some of the leads get converted while most do not.
- The typical lead conversion rate at X education is around 30% which is poor.
- To make this process more efficient, the company wishes to identify the most potential leads, also known as 'Hot Leads'.

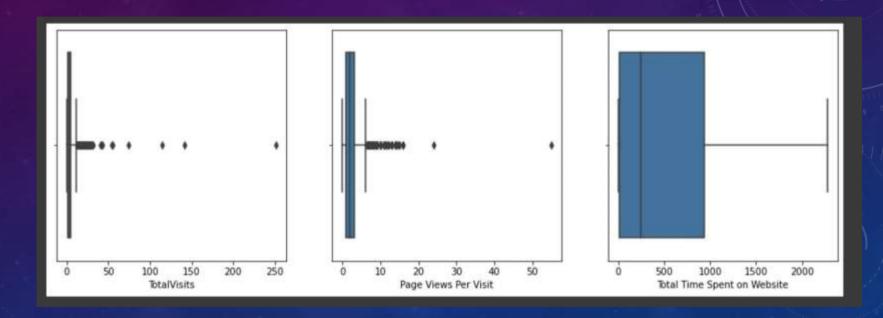

BUSINESS OBJECTIVE

- X Education wants to select the most promising leads, i.e. the leads that are most likely to convert into paying customers
- The company requires to build a model wherein a lead score is assigned to each of the leads such that the customers with a higher lead score have a higher conversion chance and the customers with a lower lead score have a lower conversion chance.
- The CEO wants to achieve the target lead conversion rate to be around 80%.

ANALYSIS APPROACH

- Data Collection
 - Importing the data and inspecting the data frame created initially.
 - Gathering the statistics related to dataframe namely shape, description of rows and columns etc.
- Data Cleaning
 - Checking for null value columns in the dataset.
 - Dropping columns with large count of NULL values.
 - Dropping unnecessary columns.
 - Imputation of NaN values in columns like 'Select', 'Last Activity' etc.

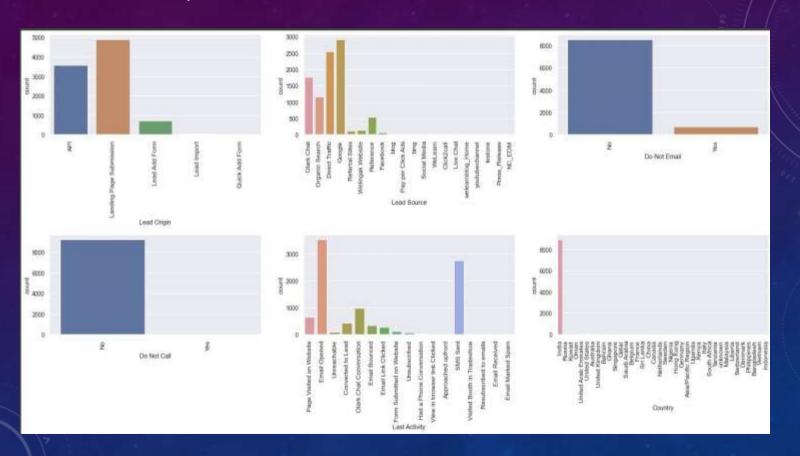

- Exploratory Data Analysis (EDA)
 - Checking for outliers.

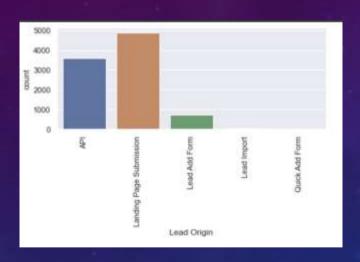

• Correlation analysis.

• Countplot to check data distribution.

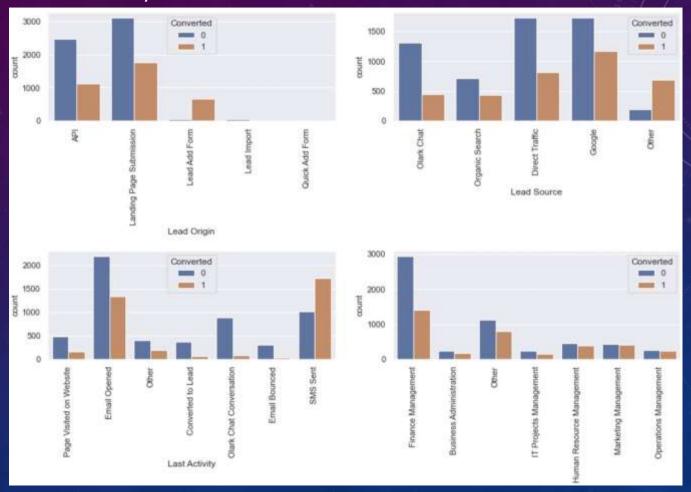

• Univariate Analysis - Categorical and Continuous.

Bivariate Analysis

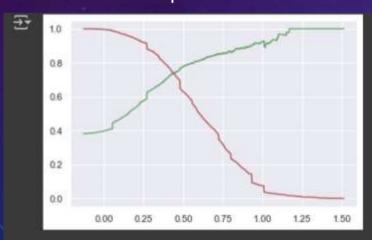

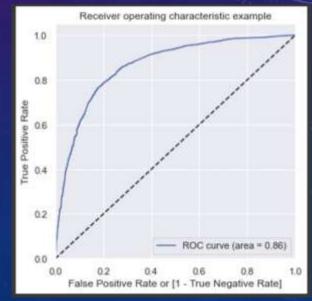

- Dummy Variable Creation
 - Creating dummies for categorical variables.
- Data Preparation and Feature Scaling
 - Splitting dataset into test and training datasets for model evaluation.
 - Scaling and transforming datasets for standardisation.
- Model Building and training
 - Creating a Logistic Regression model.
 - Training the model using training dataset.
 - Model building using different VIF values and p-values by dropping non required columns.

Model Evaluation

- Making predictions on training dataset.
- Checking for accuracy, confusion matrix, precision and other parameters.
- Graphs plotted between various output parameters.
- Test Dataset Prediction
 - Making predictions on test dataset.
 - Checking for accuracy, confusion matrix, precision and other

parameters.

RESULTS

- We can conclude the following that the variables that important the most in the potential buyers are:
 - The total time spent on the Website.
 - Total number of visits.
 - When the lead source was: a. Google b. Direct traffic c. Organic search d.
 - Olark Chat
 - When the last activity was: a. SMS b. Olark chat conversation When the lead origin is Lead add format.

Training Dataset

Accuracy: 78.57%

Sensitivity: 81.02%

Specificity: 77.06%

Test Dataset

Accuracy: 69.84%

Sensitivity: 27.85%

Specificity: 97.25%
